Did you know that the **translation quality of different machine translation engines varies depending on language pair and even industry?**

It is amazing to have this great variety of machine translation engines, however, the challenge is to select the best-fit manually for the exact translation needs.

Therefore, the need for industry-specific and language-specific machine translation is huge and getting even bigger.

Machine translation engines are modified on a periodic basis, and none of them alone can always be the best-fit for all industry and language pairs. Lugath is here to change the game! It identifies the best machine translation engine for specific industry and language pairs.

With an engine evaluated for your content, you can attain 17% more accuracy and 250% more terminology compliance.

This minimizes the edit distance and brings up significant savings.

## How do we do it?

We do it with an AI-based system called "Dynamic Routing". Lugath is set to house MT service providers as a hub and benchmark them to address the customer needs in specific industry and language pairs.

Lugath adds an intelligent and observable improvement to the translation quality of MT services; it identifies the best-fit MT engine for the translation material, removing poor translation risks.

Another key service by Lugath is automatically managed translation-memory technology. It helps companies to save on time and cost, increase flexibility, and expand options for working with alternative suppliers with centralized translation memory in the cloud. The amount of saving on costs is around 75% by having access to previously translated content.

## Connected to do it all!

We are connected with multiple MT engines to innovate your workflow with additional AI-based solutions.

Integrate now with Lugath and start using APIs or web interface for end-users!

Join Lugath to enjoy a remarkably smarter and faster translation experience.
